FEED THE DUCKS
Digital Puzzle concept

Néstor Romeral Andrés

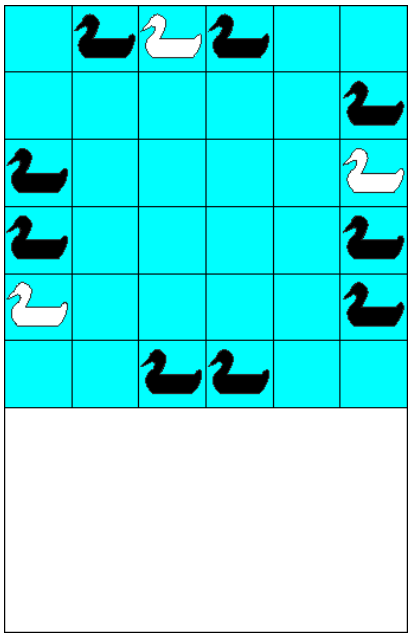

Based on the game of the same name and designer.

Level generation algorithms and parameters will be provided by designer. All will be run in local. No server needed.

One splash screen with publisher, game name.

Layout

Square lattice grid of nxn cells. ‘n’ will depend on the difficulty level, that will increase as the player solves puzzles. So the graphics must be resizeable. The designer can provide images.

SETUP

Ducks are distributed on the perimeter cells, except corners, according to an algorithm. There can be black ducks, white ducks or nothing.

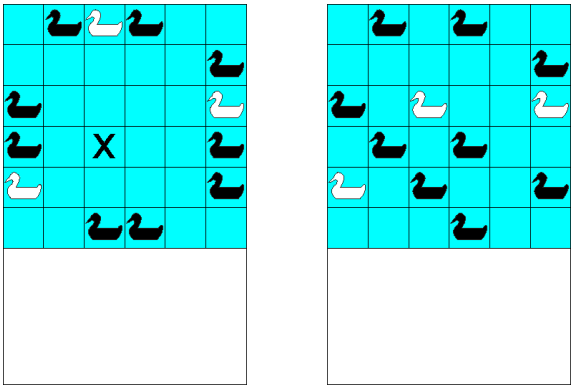

On the bottom of the screen the following should be included (among others that we can discuss)[1]:

- Turns played
- Time
- Difficulty
- Rules button
- Reset puzzle
- Other nestorgames (shows a screen with all games developed so far).
- Credits

1 Preferably the same layout in all games.

GAME PLAY

Tap on an empty cell (as if you toss a breadcrumb there, to attract the ducks). All ducks on the same row or column shall move towards that cell, but the cell will remain empty.

Notice that there can be more than one duck on either side of the cell.

The turn counter is increased.

GOAL

The puzzle is solved if all BLACK[2] ducks are arranged into a single connected group.

OTHER FEATURES

Hall of Fame (optional): Players can submit their scores (shortest time, less turns to solve) per level.

Level creation:

We’ve got 2 options here. Still undecided:

- Random level generation from parameters. Example: 5 black ducks and 3 white ducks of a 5x5 board. Placed randomly.

- Level generation from seed: Each level corresponds to a number (or hash) and it’s generated deterministically. Scores are stored by level, not by difficulty or overall.

How the difficulty will work:

The level will be a function of the difficulty. Example: Level(1)=2 black ducks on 4x4 board. Level(10)=6 black ducks and 3 white ducks on 7x7 board, and so on… with the function provided by designer.

Shall the player be allowed to choose the difficulty? We’ll discuss.

2 We can use other colours is black and white are politically incorrect. Such as Brown and Grey.
